

Press Release

Ucamco launch webinars to boost PCB CAM engineering productivity

Ucamco (formerly Barco ETS) have launched a series of webinars to help PCB CAM engineers benefit faster from new functionality. Filip Vermeire, Head of Customer Software Care at Ucamco, described the feedback from the first session as excellent. "Participants told us that they had achieved immediate productivity gains from following the webinar".

Each webinar includes a live presentation of new front-end engineering functions followed by a detailed question and answer session.

Filip Vermeire explains why Ucamco have launched the webinars: "Survival in today's global PCB market depends on handling larger number of smaller orders on shorter lead-times. This puts increasing pressure on front-end engineering. CAM engineers need to access information on new possibilities faster and more effectively. They no longer have the time to travel to conventional seminars or to explore the benefits of a new function by themselves. A webinar allows us to explain new functionality live online and provide practical demonstrations on real jobs. The interactive question and answer session means that each participant can get immediate advice on implementing solutions to his own productivity issues. We can demonstrate directly how a function will fit into his data preparation workflow".

Following the success of the first webinar Ucamco are planning further sessions both on new software releases and on particular topics.
