

INTEGR8TOR v4.2.1 PRESS RELEASE.

Faster quoting and planning from Ucamco.

Ucamco have launched V4.2.1 of their Integr8tor automatic data input and analysis software. As part of the company's continuous improvement policy, the latest version analyses and presents a larger set of critical costing and planning parameters. User feedback reports that the time needed to prepare quotations is cut by 50% and front-end engineering time by up to 30%.

More critical cost-drivers are now reported both on screen and in printed reports, e.g. the smallest SMD pad or pitch to decide which tester should be used. The new version of Integr8tor will input customer panels and analyse them.

PCB parameters that are outside capability are now automatically highlighted in red. Costing and planning engineers can see immediately where there may be problems in production. Fast feedback provides an important extra service to customers and prevents possible delays to delivery. Process and logistical information not included in CAD files (such as solder-mask colour or delivery date) can now be processed by Integr8tor using new menus. These are fully customisable to suit each user's requirements and terminology, making Integr8tor V4.2.1 easier and more secure to use by less skilled operators.

Integr8tor has been developed as a standalone costing and planning solution which can be used in any CAM environment. The new version includes additional features to integrate more closely into a Frontline Genesis CAM environment.
